

Amendments to the Claims

This listing of claims replaces all prior versions, and listings, of claims in the application.

Listing of Claims

1. (Currently amended) A buffer to be attached to an attaching member, comprising:

a grommet having a hollow tube portion, an attaching portion for holding the grommet to the attaching member, and an elastic engaging piece projecting inside the tube portion,

an engaging member slidably disposed in the hollow tube portion and having engaging step portions for engaging the elastic engaging piece,

a damper main member slidably disposed in the engaging member and having an abutting portion at a middle portion thereof in a longitudinal direction for abutting against the engaging member, and a first screw portion disposed above said abutting portion, and

means disposed between the engaging member and the damper main member for moving the damper main member in a direction away from the engaging member and fixing the damper main member relative to the engaging member so that the damper main member projects from the grommet by a desired distance, said means comprising a collar having a second screw portion for engaging said first screw portion of said damper main member, and said collar capable of being rotated, after said collar abuts against said grommet, for adjusting upward said damper main member.

2. (Canceled)

3. (Currently amended) ~~A buffer according to claim 2,~~ A buffer to be attached to an attaching member, comprising:

a grommet having a hollow tube portion, an attaching portion for holding said grommet to said attaching member, and an elastic engaging piece projecting inside said tube portion,

an engaging member slidably disposed in said hollow tube portion and having engaging step portions for engaging said elastic engaging piece.

a damper main member slidably disposed in said engaging member and having an abutting portion at a middle portion thereof in a longitudinal direction for abutting against said engaging member, and a first screw portion disposed above said abutting portion, and

means disposed between said engaging member and said damper main member for moving said damper main member in a direction away from said engaging member and fixing said damper main member relative to said engaging member so that said damper main member projects from said grommet by a desired distance, said means comprising a collar having a second screw portion for engaging said first screw portion of said damper main member, and said collar capable of being rotated, after said collar abuts against said grommet,

wherein one of said engaging member and said damper main member includes a long groove provided along a direction that the damper main member slides in the engaging member, and the other of said engaging member and said damper main member includes an elastic engaging claw engaging the long groove.

4. (original) A buffer according to claim 1, wherein said damper main member further includes a stopper for restricting the damper main member from moving in a counter-insertion direction.

5. (original) A buffer according to claim 3, wherein said damper main member further includes a stopper for restricting the damper main member from moving in a counter-insertion direction, said stopper being formed at one end of the long groove.

6. (original) A buffer according to claim 5, wherein said damper main member further includes a lower portion formed below the abutting portion and having non-circular walls inserted into the engaging member.

7. (original) A buffer according to claim 6, wherein said lower portion has the long groove with the stopper, and the engaging member has the engaging claw.

8. (new) A buffer according to claim 1, wherein said collar is engaged with the grommet such that after the collar abuts against the grommet, when the collar is rotated, the damper main member is moved upwardly to adjust height thereof relative to the collar.
